

Basic Python #6

AI Mentorship

Outline

1. Python: Classes
2. Python: Objects
3. Python: The `__init__()` Function
4. Python: Object Methods

Python: Classes

Python is an object oriented programming language.

Almost everything in Python is an object, with its properties and methods.

A Class is like an object constructor, or a "blueprint" for creating objects.

Create a Class

To create a class, use the keyword `class`:

Create a class named MyClass, with a property named x:

```
class MyClass:
```

```
    x = 5
```

Python: Objects

An Object is an instance of a Class. A class is like a blueprint while an instance is a copy of the class with *actual values*.

Create Object

Now we can use the class named MyClass to create objects:

Create an object named p1, and print the value of x:

```
p1 = MyClass()  
print(p1.x)
```

Python: The `__init__()` Function

The examples before are classes and objects in their simplest form, and are not really useful in real life applications.

To understand the meaning of classes we have to understand the built-in `__init__()` function.

All classes have a function called `__init__()`, which is always executed when the class is being initiated.

Python: The `__init__()` Function

Use the `__init__()` function to assign values to object properties, or other operations that are necessary to do when the object is being created:

```
class Person:
    def __init__(self, name, age):
        self.name = name
        self.age = age
```

```
p1 = Person("John", 36)
```

```
print(p1.name)
print(p1.age)
```

Python: Object Methods

Objects can also contain methods. Methods in objects are functions that belong to the object.

Insert a function that prints a greeting, and execute it on the p1 object:

```
class Person:
    def __init__(self, name, age):
        self.name = name
        self.age = age

    def myfunc(self):
        print("Hello my name is " + self.name)

p1 = Person("John", 36)
p1.myfunc()
```

Python: Object Methods Program Example

Create a program that uses the object method to create a personal biodata function from the input data. then display the output

Buat sebuah program yang memanfaatkan metode objek untuk membuat fungsi biodata diri dari data yang diinputkan. lalu tampilkan berupa output
